 This international preliminary examination report has been prepared by this International Preliminary Examining Authority and is transmitted to the applicant according to Article 36. 								
2. This REPORT consists of a total of	5 sheets, inc	uding this cover	sheet.					
This report is also accompanied by ANNEXES, i.e., sheets of the description, claims and/or drawings which have been amended and are the basis for this report and/or sheets containing rectifications made before this Authority (see Rule 70.16 and Section 607 of the Administrative Instructions under the PCT).								
These annexes consist of a total of sheets.								
3. This report contains indications rela	3. This report contains indications relating to the following items:							
I Sasis of the report								
II Priority								
III Non-establishment	of opinion with regard to no	velty, inventive s	step and industrial applicability

	• • •	Claims		NO		
	Industrial applicability (IA)	Claims	1-10	YES		

2. Citations and explanations

1. With respect to claim 1:

Claims

Claim 1 meets the requirements of PCT Article 33(2) to (4) for novelty, inventive step and industrial applicability.

Since none of the documents cited in the search report or acknowledged in the introductory part of the description indicates the features of independent claim 1 in their entirety, the subject matter of claim 1 is novel.

2. DE 94 22 342 U1, which represents the closest prior art, shows:

a disc brake, in particular for a commercial vehicle, with a brake caliper encircling a brake disc, said caliper being fastened to a backing plate axially displaceably in relation to the brake disc and an actuating device being arranged on a side of said caliper, with a displaceable element, in particular a crossmember, which has at least one threaded bore into which an adjusting spindle is screwed which supports a pressure member by means of

which a brake shoe may be pressed against the brake disc, with an adjusting device operatively connected to the adjusting spindle by means of which a wear-related change in the play between the brake shoe and the brake disc can be substantially compensated for, and with a safety element acting on the adjustment spindle to limit rotation until a predetermined torque is reached.

The safety element consists of a secondary seal which is arranged in the terminal area of an adjusting spindle facing the pressure member and protectively engages the adjusting spindle. The secondary seal consists of a plastics sleeve which can be pretensioned by a compression spring and which on its opposite face rests on a carrier of the adjusting spindle and whereby a rotation-limiting action is produced in this area.

The problem may be considered to consist in the complicated design and limited reliability of the safety element.

The problem is solved by providing the safety element in the form of a lock washer which lies in an annular groove of the threaded bore or the adjusting spindle and rests resiliently on the opposite thread.

None of the citations in the search report shows a lock washer which lies in an annular groove of a bore or a spindle.

The disc brake with the rotation-limiting adjusting device as per claim 1 therefore involves an

International approprior No. PCT/EP 03/12841

inventive step.

The subject matter of claim 1 may be made and used industrially and is therefore industrially applicable.

3 With respect to claims 2-10:

Dependent claims 2-10 contain advantageous and nonobvious embodiments of a disc brake according to claim 1. Claims 2-10 therefore likewise meet the requirements of PCT Article 33(2) to (4) for novelty, inventive step and industrial applicability.
